                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a DNA sequence encoding the light chain variable region of primate monoclonal antibody anti-human CD23 5E8. The invention provides primate monoclonal antibodies which specifically bind human CD23, the low affinity receptor for IgE (FceRii/CD23), and comprise either of a human gamma-1 or human gamma-3 constant region that binds to human Fc gamma receptors and inhibits IgE expression. The monoclonal antibodies of the invention are claimed to be useful for inhibiting induced IgE production for treating or preventing allergic, inflammatory and autoimmune conditions e.g. allergic rhinitis conjunctivitis, autoimmune haemolytic anaemia, etc.
                                                                                                                                                                                                                                                                                                                                          Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            auto:immune

requences, in a pBR-derived backbone, and also an anti-human CD23 IgE receptor human gamma-1 monoclonal antibody 5E8 gene. The invention provides a novel method for integrating a desired exogneous DNA at a target site within the genome of a mammalian cell via homologous recombination. This involves transfecting the cell with a 'marker plasmid' such as Desmond (see AAV61702) ......
                                                   addition, the number or colors is reduced. An amplication of the marking vector, beinserted on integration of the marking vector, area is targeted to this site, the gene is further
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cell with a 'marker plasmid' such as Desmond (see AAV61792), which contains a unique sequence that is foreign to the mammalian cell genome and which provides a substrate for homologous recombination, followed by transfection with a 'target plasmid', such as Mandy or Molly (see AAV61793), containing a sequence which provides for homologous recombination with the unique sequences contained in the marker plasmid, and further comprising a desired DNA that is to be integrated into the mammalian collaboration of the marker plasmid, and further comprising a desired DNA that is
                                                                                                                                                                                             of a functional neo protein. The method is applicable to all mammalian cells, and can be used to express any type of recombinan protein. The use of a triply spliced selectable marker means that
                                                                                                                                                                                                                                                                                              targeting plasmid, and are separated by an intron into which at least one gene of interest is cloned. Homologous recombination of the targeting vector with the integrated marking vector results
                                                                                                                                                                                                                                                                                                                                                                   dominant selectable marker The neo gene is split into 3 exons Exon 3 is present on the marker plasmid and becomes integrated into the host cell genome upon integration of the marker plasminto the mammalian cells. Exons 1 and 2 are present on the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               baculovirus DNA, a cassette comprising the promoter and enhancer elements from cytomegalovirus and Sy400 virus, the E. coli beta-glucuronidase (GUS) gene, firefly luciferase gene, an inactivated Salmonella typhimurium histidinol dehydrogenase (HisD)
                                                                                                                                                                        protein. The use of a triply spliced selectable marker meall selected colonies arise from homologous recombination.
                                                                                                                                                                                                                                                                                                                                                                                                                                           immunoglobulin or other secreted mammalian glycoprotein. The homologous recombination system utilises the neo gene as a dominant selectable marker. The neo gene is split into 3 exons.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  selectable marker and target plasmids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Site specific integration of DNA in mammals for expressing,
                                                amplification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        to be integrated into the mammalian cells, typically an

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Š
This invention describes a novel humanized anti-Fas antibody-like molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas ilgand system, by binding to Fas on the cell surface, and prevents apoptosis in cells with a normal system, by inhibiting binding between Fas and its ligand. The products of the invention have anti-inflammatory, anti-anemic, antidiabetic, anti-allergic, anti-arthritic, antiviral, immunomodulatory, dermatological, immunosuppressive, thyromimetic, anti-rheumatic, nephrotropic, anti-infertility, neuroprotective, antiarteriosclerotic, cardiant and hepatropic activity. (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic versus host disease, Slorgen's syndrome, pernicious or hypoplastic anemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's disease, autoimmune hemolytic anemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      dermatological; immunosuppressive; thyromimetic; antirheumatic; anti-Fas nephrotropic; antiinfertility; neuroprotective; antiarteriosclerotic; hepatotropic; humanized; apoptosis; systemic lupus erythematosus; Hashimoto disease; rheumatoid arthritis; graft versus host disease; Sjorgen's syndrome; anemia; Addison's disease; scleroderma; sterility; Goodpasture syndrome; Crohn's disease; sterility; myasthenia gravis; multiple sclerosis; Basedow's disease; thrombopenia purpura; allergy; insulin dependent diabetes mellitus; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; hepatitis; transplant rejection; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            7901
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             7841

(I) selectively inhibit apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they mimic the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-murine antibody response. This sequence represents a human immunoglobulin light chain kappa variable region subgroup type I which is used in the construction of humanised anti-fas antibody constructs described in the method of the invention.
                                                                                                                                                                                                                                                                                                                   Homo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 729 BP; 192 A; 200 C; 182

The isotype of a MAb secreted by the human/human hybridoma HT was determined to be and kappa. Human MAb was purified, and the antigen recognised human MAb CLN*-IgM identified by western blotting.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 12;

The antibodies can bind to human Tumour Growth Factor-beta (TGF-beta) II receptor, resulting in the inhibition of the signal transduction of hum TGF-beta into cells. The antibodies can be used for the prevention and treatment of diseases associated with the production of TGF-beta, such tissue fibrosis in the lung, liver, skin, kidney or other tissues, atopy, keloid and arthritis. The present sequence was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human monoclonal antibodies recognizing human TGF-beta II receptor useful for treating TGF-beta associated diseases such as tissue

immunomodulatory molecule (AILIM). (I) is useful for modulating signal currents duction into a cell mediated by AILIM, for modulating proliferation of AILIM-expressing cells, for modulating proliferation of AILIM-expressing cells, and for inducing antibody-dependent cytokine from AILIM-expressing cells. (I) is useful for treating, or apoptosis of AILIM-expressing cells. (I) is useful for treating or prophylaxis of delayed type allergy. (I) is useful for treating and preventing various diseases associated with AILIM-mediated costimulatory transduction, and for inhibiting the onset and/or advancement of the diseases. (I) is useful for suppression, prevention and/or treatment of rheumatoid arthritis, multiple colorosis, autoimmune thyroiditis, allergic contact-type dermatitis, chronic inflammation, graft versus host reaction, graft versus host consolidates, inflammation, graft versus host reaction, graft versus host casease, immune rejection, disorders caused by abnormal intestinal culture colitis, pneumonia, hepatitis, mephritis, vasculitis, and consolidate immunity, specifically inflammatory intestinal disorders such as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 antiallergic; antiller; neuroprotective; antithyroid; vasotropic; immunosuppressive; dermatological; antiinflammatory; hepatotropic; activation inducible lymphocyte immunomodulatory molecule; AILIM; monoclonal antibody; allergy; rheumatoid arthritis; diabetes mellitus; multiple sclerosis; autoimmune thyroiditis; psoriasis; hepatitis; allergic contact-type dermatitis; chronic inflammatory dermatosis; systemic lupus erythematosus; autoimmune disorder; inflammation; ss; graft versus host reaction; immune rejection; intestinal immunity; ulcerative colitis; pneumonia; nephritis; vasculitis; pancreatitis.
                                                                                                                                                                                                                        pancreatitis. (I) induces no serious immunorejection due to antigenicity to human, i.e., human anti-mouse antigenicity (HAMA) in a host. AAS99444-AAS99477 represent anti-human AILIM monoclonal antibody coding sequences and PCR primers of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel human antibody (I), preferably a human monoclonal antibody which binds to an activation inducible lymphocyte immunomodulatory molecule (AILIM). (I) is useful for modulating signal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 45; Page 267-270; 300pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        arthritis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New human monoclonal antibody that binds to activation inducible lymphocyte immunomodulatory molecule, useful for treating rheumatoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       HAM:

ATGGACATGAGGGTCCCCGCTCAGCTCCTGGGGCTCCTTCTGCTCTGGCTCCCAGGTGCC

The present sequence encodes a kappa chain of an antibody of the invention. The antibody is directed cytotoxic T-lymphocyte antigo (CTLA)-4. Antibodies of the invention are composed of a heavy chi

chain

Example 2; Fig 22r; 157pp; English.

The modifications are contained in CDR1, CDR2 and/or framework regions. The antibodies may be used to inhibit CTLA-4 and down-regulate the immune system to treat hyperimmunity disorders (e.g. autoimmune disease, diabetes and graft rejection) and proliferative disorders (e.g. cancer). CTLA-4 stimulatory agents may be used to up-regulate immune system to up-regulate immunodeficient disorders.

The Abs are prepared by grafting CDRs from a non-human antigen-specific donor antibody onto homologous Old World ape or monkey acceptor frameworks. The Abs have reduced immunogenicity and are better tolerated in humans (because of the close similarity between the human and primate proteins), but retain the full antigen-binding affinity of the donor
                                                                                                Complementarity Old World ape;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention provides an antibody (Ab) comprising donor CDRs (complementarity determining regions) derived from a non-human antigen-specific donor antibody, and an acceptor framework from a non-human primate. The Abs are prepared by grafting CDRs from a non-human antigen-specific donor antibody onto homologous Old world ape or monkey acceptor frameworks. The Abs have reduced immunogenicity and are better tolerated in humans (because of the close similarity between the human and primate proteins), but retain the full antigen-binding affinity of the donor

The present sequence represents a human light chain variable region partial nuclectide sequence, 10C5 kappa, which encodes an amino acid sequence from a claimed immunoglobulin that specifically binds human CD4. The anti-CD4 antibodies may be used in therapeutic and diagnostic applications, especially for the treatment of human diseases. These antibodies reduce activity of CD4 cells and reduce undesirable autoimmune reactions, inflammatory response and transplant rejection. Transgenic animals are capable of producing heterologous antibodies of multiple isotypes by undergoing isotype switching. These animals produce a first I g type that is necessary for antigen-stimulated B-cell maturation and can switch to encode and produce one or more subsequent

RESULT 1
AAV39239
 producing a human heterologous antibodies of multiple isotypes by undergoing isotype switching. The transgenic animals have human heavy and light chain transgenes. The transgenes are capable of functionally rearranging a heterologous diversity (D) gene in a variable-diversity-junction (V-D-J) recombination. The transgenes include a heavy chain transgene comprising at least one V, D and J gene segment, and one constant region gene segment. The immunoglobulin (Ig) light chain transgene comprises at least one V and J gene segment and one constant region gene segment. The gene segment and one constant region gene segment. The gene segment are heterologous to the transgenic animal. The antibody can be used to prevent efflux of neutrophils from vasculature. It can also be used to treat reperfusion injury. CD4 binding antibodies are used to reduce undesirable autoimmune reactions, inflammatory responses and rejection of transplanted organs. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Transgenic animal; human heterologous antibody; transgene; isotype switching; neutrophil efflux; reperfusion injury; CD4 bindin autoimmune reaction; inflammatory response; transplant rejection; acid induced lung injury; acute adult respiratory distress syndrome; ARDS; vasculitis; septic shock; allergic reaction; asthma;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       light chain transgene. The B cells are fused to immortalized cells suitable for generating a hybridoma, which produces a detectable amount of an immunoglobulin that specifically binds digoxin or Shinga-like toxin. B cells from transgenic animals can be used to generate hybridomas expressing monoclonal high affinity human sequence antibodies. Antibodies produced from the transgenic animals of the invention can be used to treat human diseases, e.g. autoimmune diseases, cancer, infectious disease, transplant rejection, blood disorders such as coagulation disorders and other diseases. The present sequence represents a partial nucleotide sequence for a functional transcript used in the course of the invention.

IGFAM-10 gene, which was isolated from a cDNA library of colon cc tissue. It is expressed in reproductive, gastrointestinal and cc cardiovascular tissue, where cancer and inflammation are common. The cc gene, protein, its antibodies, agonists and antagonists are suitable for cc diagnosing and treating many diseases, including cancer, immune system cc disorders (such as inflammation, AIDS, allergies, anaemia, crohn's cc arteriosclerosis, asthma, atherosclerosis, cholecystitis, Crohn's cc disease, diabetes mellitus, emphysema, Graves' disease, hepatitis, cc multiple sclerosis, psoriasis, rheumatoid arthritis, scleroderma, csystemic lupus erythematosus and ulcerative colitis), complications of cancer, haemodialysis and extracorporeal circulation, trauma and chaematopoietic cancer (such as leukaemia) and infections caused by colored and constructions of sactoria, viruses, fungi or parasites.
